

## Key new functionality in this release:

- ✓ Support for Soft Tokens with zero admin overhead
- ✓ Soft Token application available for **iPhone**, **Blackberry** and **Android**
- ✓ Support for Google Authenticator software token
- ✓ Quick Response Code (QRcodes) for rapid user enrolment of Soft Token records
- ✓ User can switch between SMS, Soft Tokens and back to SMS as they switch phones
- ✓ Enrolment interface extended to support QRcodes for scanning with phone camera

## Support for Soft Tokens

SecurEnvoy now provides soft tokens for your phone to generate one time passcodes (OTP) for two-factor authentication that can be checked by your company's SecurEnvoy server. End-users have total flexibility with zero admin or overhead costs providing a mobile security solution to suit the user. Multiple soft tokens can be enrolled and used within the same app for multiple SecurEnvoy servers eliminating the need to carry multiple hardware tokens or install multiple soft token apps.

## Soft Token application available

The latest SecurEnvoy server V6 allows users far greater choice of security - either tokenless SMS two factor authentication or a soft token downloaded as an application. Available free of charge to current customers, users can select to use a soft token application from either SecurEnvoy or Google. Authentication soft tokens are suitable for most types of mobile devices i.e. iPhones, iPad's, Blackberry's, Android phones, Mac and Windows operating systems including XP and Windows 7.

Multiple soft tokens can be enrolled and used within the same app for multiple SecurEnvoy servers eliminating the need to carry multiple hardware tokens or install multiple soft token apps.

## Support for Google Authenticator

SecurEnvoy soft tokens for your phone or desktop can be used to generate one time passcode (OTP) for two factor authentication that can be checked by your company's SecurEnvoy server or Google's cloud login.

## Quick Response codes

Quick Response codes are an excellent method to display a bar code matrix for the deployment of the "seed record" for the end user's Soft Token. The user only has to scan the QR code with their phones camera to ensure a fully automatic enrolment process to a Soft Token.

## User Enrolment Interface

### *End user convenience of enrolment*

A simple process for the organisation there is nothing they need to do. It is all down to the personal preference of the end-user to choose whether they want their two factor authentication passcode sent via SMS or via their app.
